Catalyst

Launch tokens on what happens next.

Built on Meteora DBC, DAMM v2, DLMM · Event data from Panta

THE PROBLEM

Launchpads ignore the moment

01

Launches ride on real-world moments

02

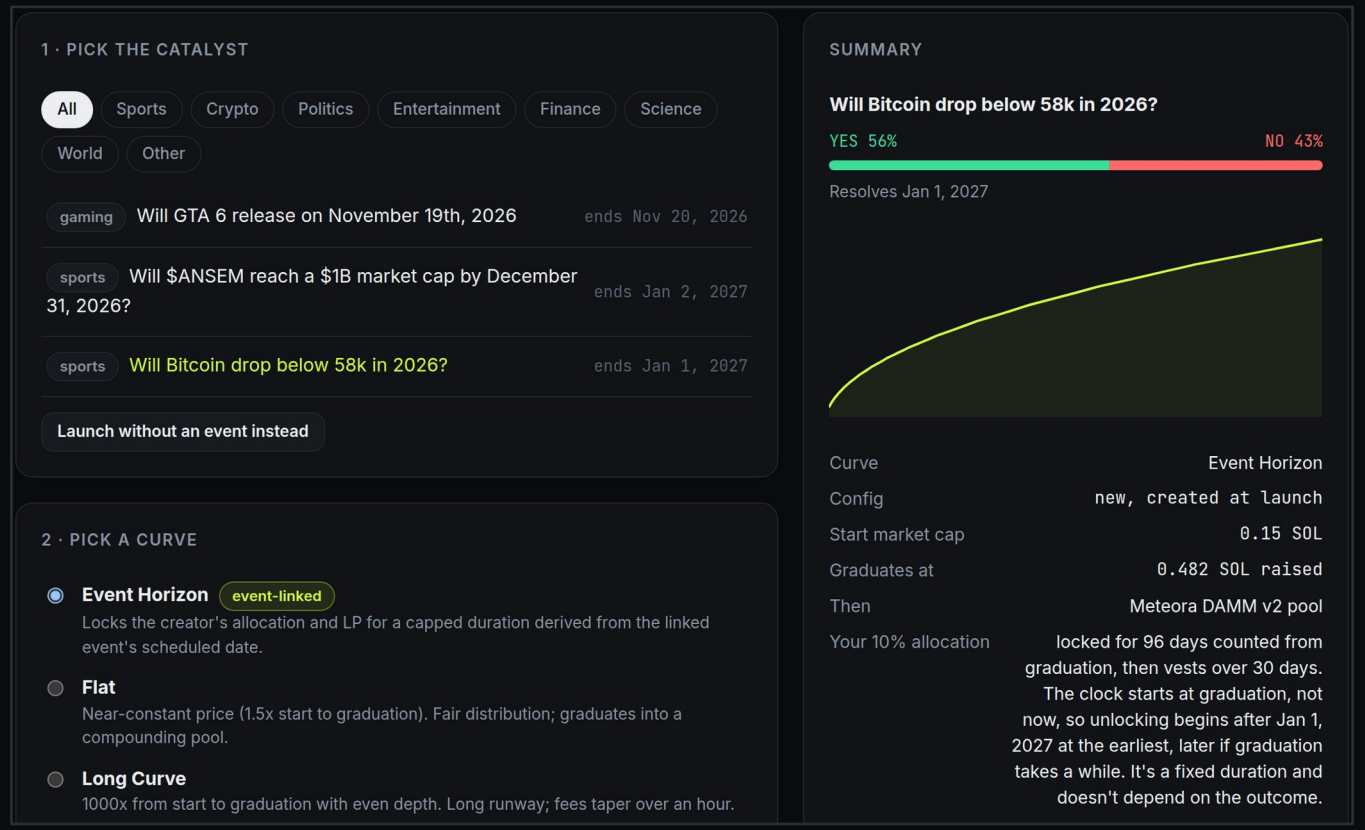

Creators can dump when the hype peaks

03

Every launchpad rebuilds the same curve math

How it works

1. Pick a real event
2. Pick a curve preset
3. Launch in one or two approvals

Live app: /launch with a Panta event selected (Solana devnet)

AFTER THE CURVE FILLS

Graduation, then real liquidity

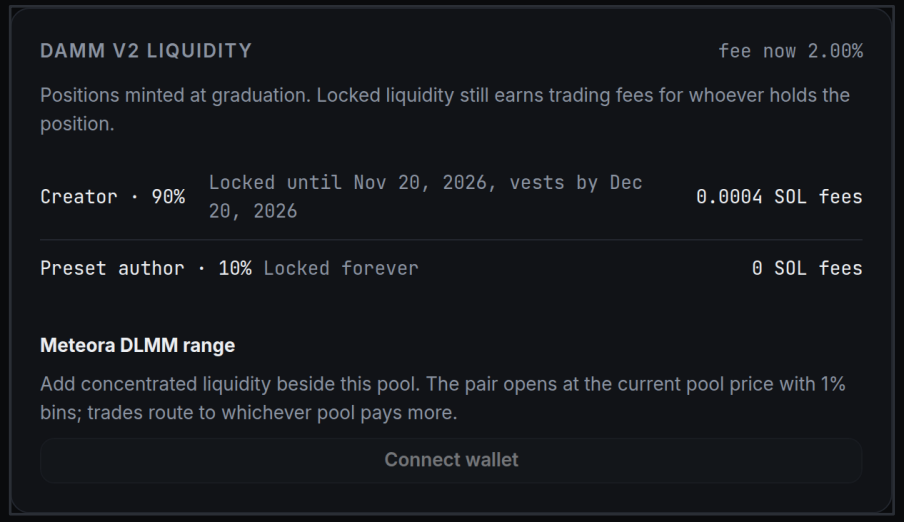

DBC curve
Meteora bonding curve

→

DAMM v2 pool
Anyone can graduate it

→

DLMM range
Optional, beside the pool

Live: a graduated token's DAMM v2 positions

- Event Horizon: creator LP locked, still earning fees
- Trades go to whichever pool pays more

WHY METEORA + PANTA

No custom contract

Meteora

- Curve, fees and locks live on-chain
- Graduation and DLMM built in

Panta

- Live events and dates, used as data

Live token page: Meteora curve + Panta event data

BUILT AND WORKING TODAY

Live on Solana devnet

4
curve presets

30+
automated tests

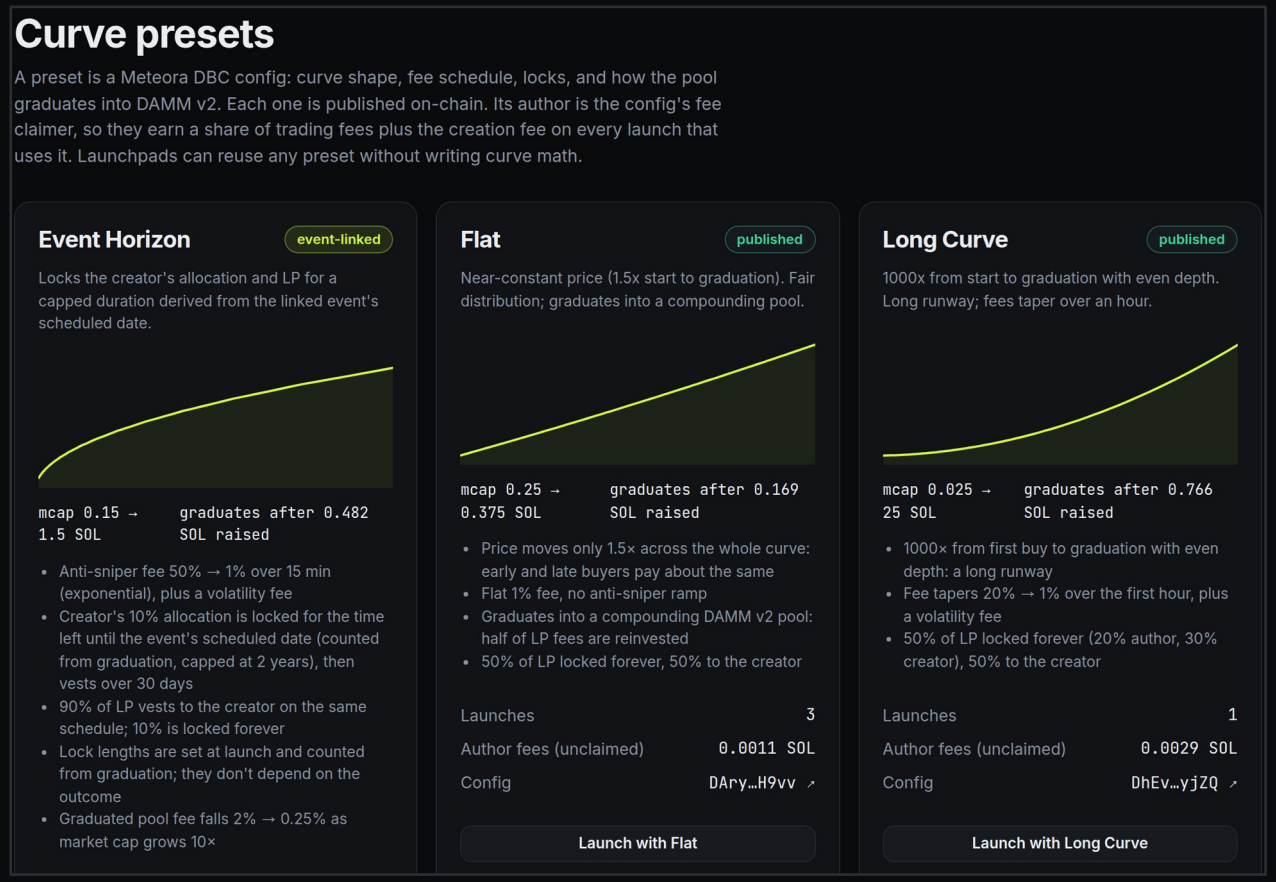

8
steps in the full on-chain test

Launch, trading, graduation, locks, DLMM, presets all work. **No users yet. That's next.**

GO TO MARKET

India first

1. Community builders launch on shared presets
2. Preset authors earn fees on every launch
3. Start with Superteam India and hackathon groups

Live app: the preset marketplace (/presets)

Solo builder · India

The ask

1. Try Catalyst on devnet
2. Tell me which curves you'd use
3. Help take it to mainnet
